

Research Opportunity!

We need healthy children 6 to 24 months of age to participate in a Respiratory Syncytial Virus (RSV) vaccine study

Help us determine if an RSV vaccine given is well tolerated by children and results in a good immune response.

What's involved?

Children 6 to 24 months of age will receive 1 or 2 doses of a new RSV vaccine or placebo as a nose spray. 4 out of 5 children will receive the vaccine and 1 out of 5 the placebo. Some may receive a second dose depending on randomization.

There will be 10-15 clinic visits and multiple follow-up phone calls over about 12-13 months.

Compensation

All participants will be compensated \$100 for completed clinic visits and \$20 for completed telephone calls.
